

Vyopta Releases vControl® PRO for Cisco/TANDBERG Systems

AUSTIN, Texas - August 2, 2010. Vyopta Incorporated, a premier software developer of video and unified collaboration applications, today released a new software application that enables users of current model Cisco/TANDBERG video conferencing systems to control video and voice calls and conferences. The new application, Vyopta vControl® PRO, runs on the Microsoft Windows platform.

Much like the previously released vControl® application for Apple products, vControl® PRO can easily initiate video and voice calls and quickly join video and voice conferences through its universal interactive user interface. However, vControl® PRO has extended views that provide the users (from the novice and power user to the administrator) with additional information and functionality. Some of these new features include:

- Intuitive graphical interface with synchronized address books and call history
- Easy URI dialing and capability for SIP integrated audio conferencing
- Remote call control for administrators with web snapshot views
- Expanded source selection by software activation of additional inputs
- Optional video compositing control capabilities

"One of the key challenges for rapid adoption of video communications is the user experience," said Alfredo Ramirez, President of Vyopta. "Vyopta is committed to developing and advancing unique video and unified collaboration applications that enhance user experience to drive adoption of video communications that support critical business functions."

Vyopta vControl® PRO reduces the complexity of deployment and total cost of ownership associated with video conference endpoint systems. By simplifying the implementation and use of video technologies, Vyopta vControl® PRO is intended to encourage adoption of video and unified communications technologies and ease the support burden for administrators.

Please contact Vyopta for additional information or to purchase vControl® PRO.

About Vyopta Incorporated
